- 13. Offer & Pricing Intelligence
- 14. Ad Angles & Hooks

- **15.** Must-Read Sources for the Copywriter

PART 1: STRATEGIC DIAGNOSIS

Executive overview and the four foundational market verdicts

Section 1 — Executive Summary (Quick Reference)

This is the one-page cheat sheet. Everything above is explained in detail in Sections 1–14.

Who Is This Person?

An adult between 40 and 65, living in the US, with Type 2 diabetes. They are exhausted, frustrated, and deeply afraid. They are tired of a medical system that dismisses their severe side effects and simply hands them higher doses of medication. They wake up every morning to a high blood sugar reading regardless of how strictly they dieted, and this physical betrayal ruins their day before it starts. They feel profound shame because society tells them their disease is their own fault. They hide their struggles from coworkers and family. They just want their normal, independent life back.

What Do They Want?

Surface: Wake up with normal blood sugar numbers without taking pills that cause severe stomach pain and fatigue.

Deep: Stop feeling like a broken burden, reclaim their lost dignity, and prove to their doctor and family that this disease was not their fault.

What Do They Already Believe?

- The medical system is failing them
- Metformin is making them sicker
- They've heard "lower your blood sugar naturally" a hundred times and are highly skeptical of scams

Their Emotional State

Apathy (Hawkins Level 50) bleeding into Anger (Hawkins Level 150). They sit in apathy while scrolling. The copy needs to lift them into anger at the medical establishment to give them the energy to act.

The #1 Blocking Belief

"I am genetically broken, and diabetes is a progressive disease that will eventually kill me no matter how hard I try or what I eat."

What This Market Is Missing

A solution that honestly explains **why their blood sugar spikes while they sleep**, and a concrete plan that treats the root cause in the liver rather than just trying to hide the sugar using medication.

The Strongest Piece of Real Proof

Clinical data showing that the Dawn Phenomenon is caused by the liver dumping glucose overnight due to hepatic insulin resistance, **not by eating too many carbohydrates the day before**. Intermittent fasting protocols have been clinically proven to drain liver fat and allow patients to safely discontinue insulin.

Claims That MUST NOT Be Used

The product concept implies that honey can naturally reverse diabetes or safely lower blood sugar. This is **completely false and medically dangerous**. The strongest clinical trials prove that daily honey consumption increases HbA1c and worsens glycemic control. The copywriter must pivot to a whole-foods and fasting lifestyle mechanism.

The One Emotional Nerve the Hook Should Hit

The bitter, heavy frustration of waking up, testing your blood, seeing a high number, and realizing another day of your life is ruined before you even stepped out of bed.

What We Still Don't Know

- Whether this buyer prefers a one-time payment or monthly subscription for digital educational programs
- Exactly how much they've spent out of pocket on testing strips and copays this year alone
- Which specific hobbies they quietly gave up because of neuropathy and fatigue

Section 2 — The Four Big-Picture Verdicts

8.1 What They Really Want (Mass Desire Verdict)

On the surface: Lower their morning blood sugar without taking drugs that cause diarrhea.

Deep down: Restore their independence, clear their name of the "lazy" stigma, and reclaim their physical energy.

This desire is **strong and growing**, fueled by the rising costs and side effects of conventional diabetes drugs. The desire to be healthy, energetic, and free of medical burdens existed long before modern drugs were invented.

8.2 How Aware They Are (Awareness Verdict)

Segment	Awareness Level	What This Means
Forum-active population	Most Aware	They're debating the exact cellular mechanisms of the dawn phenomenon and insulin resistance
Active searchers	Solution Aware	They know about diets, pills, and fasting, but are looking for the right program
Cold scrolling population	Problem Aware	They know their stomach hurts and they're tired, but they don't know the liver is to blame

Important: Cold traffic ads MUST target the Problem Aware stage. Leading with advanced mechanisms will confuse them. Leading with the shared pain of morning fatigue and bathroom trips will hook them instantly.

8.3 How Sophisticated They Are (Sophistication Verdict)

Level 3. They have heard "reverse your diabetes naturally" and "lower your blood sugar with this one trick" a thousand times. They are **highly skeptical**.

Burned-out claims: "Miracle cure," "Dr. Oz approved," "Secret Amazonian berry," "Just take this one pill." Competitors like Sugar Balance and FitSpresso have ruined the simple supplement claim.

What still breaks through: Deep empathy for Metformin's side effects, clear scientific explanations of liver function (the dawn phenomenon), and programs that focus on whole foods and intermittent fasting rather than magic pills.

8.4 Their Emotional State (Consciousness Verdict)

Using the Hawkins Scale:

Level	Score	What It Sounds Like
Floor (when judged)	Shame (20)	—
Baseline	Apathy (50)	"I am so very fatigued and weak," "I don't even know why I keep trying," "I'm afraid it's already over for me"
Ceiling	Anger (150)	"My doctor was such a jerk," "A total scam," "I hate Metformin"
Where they need to get	Courage (200)	Ready to take action

Copy Strategy: When they're scrolling on their phones, they're sitting in Apathy. Your copy must **lift them from Apathy into Anger** (at the medical system or the disease itself) to give them the emotional energy to act.

PART 2: THE AVATAR

Who the buyer is, what they feel, how they think

Section 3 — The Main Buyer

This is a detailed portrait of the person most likely to buy this product.

6.1 Who They Are

Age	45 to 65
Gender	Skews slightly male
Location	United States
Insurance	They have health insurance but face high out-of-pocket costs for testing strips and daily drugs
Job	They hold a steady job but struggle to get through the afternoon without a nap due to extreme fatigue
Weight	Carrying extra weight, mostly around the middle
Diet History	Have tried low-carb diets before with mixed success

6.2 A Typical Day in Their Life

6:30 AM — They wake up groggy and un-rested. Before they even brush their teeth, they prick their finger to check their blood sugar. The meter reads 155. Their heart sinks. They ate perfectly yesterday, skipped dessert, ate a small dinner, yet their liver still dumped sugar all night.

7:00 AM — They swallow their giant Metformin pill with breakfast, dreading the stomach cramps that will hit by 9:00 AM.

9:00 AM — At work, they map out the fastest route to the restroom.

2:00 PM — A crushing wave of fatigue hits. They want to lay their head on the desk.

3:00 PM — They skip the office birthday cake, feeling everyone watching them and judging them.

10:00 PM — They go to bed anxious about what the meter will say tomorrow morning.

6.3 The Recurring Painful Moments

- Waking up and seeing a high number despite fasting: *"Sometime it'll be the highest reading I get all day."*
- The sudden, frantic rush to the bathroom after a meal: *"The crap your bed or pants kind."*
- The crushing afternoon fatigue: *"Sleeping 16 hours a day and the rest of the time too tired to get off the couch."*
- Being offered a sweet treat and having to awkwardly decline
- The doctor ignoring their complaints: *"My primary insisted I go back on it and that any fatigue I had was unrelated."*

6.4 Their Workarounds (Things They Do to Cope)

- Taking the pill in the exact middle of a heavy meal to avoid nausea
- Mapping out bathrooms before going anywhere
- Skipping breakfast entirely to keep morning numbers lower
- Eating a late-night protein snack hoping to trick the liver
- Taking a 30-minute walk immediately after checking morning numbers

6.5 What They've Quietly Stopped Doing

- Stopped eating out with friends because explaining their diet is too exhausting
- Stopped going on long car rides because they fear sudden bathroom emergencies
- Stopped trusting doctors who dismiss their severe side effects

6.6 Who Knows and Who Doesn't

Their spouse knows. Their doctor knows. **They actively hide it** from coworkers (they don't want pity or unsolicited diet advice) and from extended family (to avoid lectures about eating too much sugar).

6.7 Their Emotional Day

Moment	What They Feel
Morning — high number on the meter	Defeat
Seeing a coworker eat a massive donut	Anger at the unfairness
Watching ads for "miracle" diabetes cures	Extreme skepticism (they roll their eyes)
Spending money on strips, pills, supplements	Profound anger that they spend hundreds and only feel worse

6.8 How They Actually Talk

They are blunt, tired, and use dark, self-deprecating humor. They swear when discussing their symptoms ("crap my pants," "stupid liver"). They use clinical terms accurately (A1c, fasting glucose, dawn phenomenon, neuropathy). They sound like veteran soldiers describing a grueling, endless war.

6.9 Their Deepest Desire

They want to eat a normal dinner with their family without doing mental math, go to sleep without anxiety, and wake up with energy. **"I just want to live my life without thinking about my pancreas every five minutes."**

6.10 What They've Already Tried (and Failed)

Year	What They Tried	What They Expected	What Actually Happened
Year 1	Metformin 500mg	A quick fix	Diarrhea and fatigue
Year 2	Low-carb diet	To cure it	Numbers dropped initially but diet was too hard to maintain

Year 3	Metformin ER 1000mg	Less stomach pain	Zombie-like fatigue, giving up on hobbies
Year 4	Random internet supplements	A miracle	Billed \$100/month for useless pills

Total spent: Thousands in co-pays, strips, and supplements.

6.11 Their Identity Crisis

This disease directly threatens their identity as a **capable, independent, healthy adult**. It forces them into the identity of a "sick person" who is a burden to their family and a slave to the pharmaceutical industry. They want their independence back.

"I am afraid of being more of a joke than I already am."

6.12 Their Internal Monologue

"I cannot believe this is my life now. I did everything right yesterday. I ate the chicken. I ate the broccoli. I skipped the potatoes. I went to bed hungry. And what does my stupid liver do? It dumps sugar into my blood all night. 160 this morning. Why do I even try? I'm going to take this giant pill that makes me feel like a zombie and gives me the runs. My doctor doesn't care. He just looks at his chart and tells me to lose weight. Easy for him to say. He doesn't feel this bone-deep exhaustion. I don't want to tell my wife how bad it is. I don't want her worrying about me dropping dead of a heart attack or losing a foot. I'm just so tired. I'm tired of the finger pricks, I'm tired of the bathroom panics, and I'm tired of feeling like this is all my own damn fault."

Section 4 — The Emotional Core

This section breaks down what drives the buyer to take action: their desires, beliefs, identity, and decision-making process.

Part A — What They Want (Desires)

Surface-Level Desires (What They Say Out Loud)

- Lower their A1c: *"Today my a1c is 4.9 without meds"*
- Stop the morning sugar spikes: *"Fixed the dawn phenomenon for me"*
- Stop taking Metformin: *"I stopped taking it completely for now"*
- Have solid bowel movements: *"So tired of the runs and discomfort"*
- Get energy back: *"All my energy came back"*
- Lose weight
- Eat a normal meal without their blood sugar skyrocketing
- Avoid needles / insulin injections

Deep Desires (What They Really Mean)

When They Say...	They Really Mean...
"I want lower blood sugar"	"I want my doctor to look at me with respect instead of pity or blame"
"I want to stop taking Metformin"	"I want to stop feeling tied to the toilet and terrified of leaving the house"
"I want to fix the dawn phenomenon"	"I want to feel like I have control over my own body again"
"I want a natural solution"	"I want to prove the medical establishment wrong"
"I want more energy"	"I want to be an active participant in my family's life again, not a ghost on the couch"

Toward or Away?

They are overwhelmingly motivated by getting **AWAY** from pain. They want to escape the fatigue, the bathroom emergencies, the high morning numbers, and the shame. **Your copy must open with relief from the pain before moving to any kind of aspiration.**

Part B — What They Believe (Notions)

Firm Beliefs (Hard to Change)

- "My doctor does not understand what I go through every day"
- "Metformin causes terrible side effects"
- "It feels like I am shooting alcohol out of the wrong hole"
- "Carbs raise my blood sugar" — "cutting out everything I love"
- "The pharmaceutical industry just wants to sell me more drugs"
- "Fake doctors on the internet are trying to scam me"
- "This disease is exhausting — it's a real grind"

Shakeable Beliefs (You CAN Change These)

What They Currently Believe	How to Shake It
"I have to eat heavy meals to handle the pills"	Show them a method that doesn't require pills at all
"My liver is broken and will always dump sugar"	Show them how to drain the liver fat naturally
"I will eventually need insulin"	Show them case studies of real people getting off insulin
"A natural supplement can cure this easily"	Explain why a holistic lifestyle approach is what actually works
"Fasting is too hard"	Show them intermittent fasting is easier than running to the bathroom

"Honey might be a safe sugar"

Prove to them that sugar is sugar, but natural whole foods heal

What They Already Accept

- "I am tired of feeling like a zombie"
- "My morning numbers are out of control"
- "The standard medical advice is not working for me"
- "I hate pricking my finger"
- "I am willing to try natural foods if they actually work"

Solutions They Still Believe In

- Strict low-carb or keto diets (they know these work mechanically, even though they're incredibly hard to stick to)
- Intermittent fasting (they've heard it works and are curious)
- Natural, whole-food ingredients (they trust olive oil, vegetables, and clean eating)

Solutions They've Lost Faith In

- Metformin: *"I stopped taking it completely"*
- Long fake video sales letters: *"Instead of 40 mins waffling on..."*
- Celebrity-endorsed miracle pills
- Generic doctor advice to just "lose weight"

Part C — How They Identify Themselves

Labels They Use

someone like me

Type 2 diabetic

a massive hypochondriac

a guy who eats everything

a cancer patient

a joke

older people

Their Tribes

Type 2 Diabetics. Low-Carb dieters. Natural health seekers. Anti-Big Pharma skeptics.

Important Identity Labels

Label	How It Feels to Them
"Type 2 Diabetic"	Heavy burden — they hate this label and want to shed it
"Natural health seeker"	Proudly defended — this is their chosen identity
"Low-carb dieter"	Casual and descriptive

In-Group Vocabulary

- **"A1c"** — The 3-month blood sugar average that determines their fate at the doctor
- **"Dawn phenomenon"** — The morning liver sugar dump that ruins their day
- **"Fasting glucose"** — Blood sugar level after sleeping
- **"Metformin ER"** — Extended-release version that supposedly fixes stomach issues
- **"Hypos"** — Dangerous low blood sugar crashes
- **"Spiking"** — A sudden rapid rise in blood sugar after eating
- **"Going low"** — Blood sugar dropping dangerously
- **"Neuropathy"** — Nerve pain or numbness in the feet or hands
- **"The runs"** — Medication-induced diarrhea
- **"Finger prick"** — Testing blood sugar with a lancet
- **"Keto"** — A very low carbohydrate diet

What Outsiders Get Wrong

Outsiders assume they got diabetes because they're lazy and ate too much sugar. The group rolls their eyes at this because many of them exercise and eat well, yet their liver still dumps glucose uncontrollably.

Safe vs. Dangerous Labels in Your Copy

Safe to Use	Never Use
Hard-working adult	"Diabetic" (many hate the label)
Someone frustrated with the medical system	"Lazy"
A natural health advocate	"Sugar addict"

"Adults over 40"

"Obese" or "fat" (triggers deep shame)

Part D — Their Characteristics

- **Age** carries emotional weight (they feel older than they are due to intense fatigue)
- **Weight** carries emotional weight (they feel judged for their body size)
- They have **disposable income** but are highly skeptical of scams
- They use **Facebook and YouTube** regularly and know exactly how to spot a fake review

Part E — The Decision Layer

The Blocking Beliefs (What Stops Them From Buying)

1. "Nothing will actually cure this, it's progressive." → Makes them apathetic
2. "This is just another internet scam." → Makes them close the page immediately
3. "I'll have to starve myself or eat only lettuce." → Makes them dread the solution
4. "My doctor will be mad if I stop my pills." → Makes them fear authority

The ONE Enabling Belief That Unlocks the Sale

"My liver is just clogged with fat, and if I change when and how I eat natural foods, the liver will unclog and my morning numbers will drop automatically."

Which Door Opens Fastest?

The **Notions door**. Their firm belief that the medical system is failing them and just masking symptoms with pills that make them sick. **Validating their deep anger at the medical system is the absolute fastest way to build trust.**

Section 5 — Five Levels of Avatar Depth

This shows you how deep you need to go when writing for this buyer — from surface-level thoughts down to their core identity.

Level 1 — Conscious Thoughts (Surface)

These are the things they're literally thinking throughout the day:

- "I hope my stomach doesn't act up during this meeting"
- "I wonder what my number is going to be tomorrow morning"
- "I am so tired I could sleep under my desk"
- "I wish my doctor would actually listen to me"
- "I can't believe I have to eat this bland food forever"
- "Why did my blood sugar spike after just eating chicken?"
- "I hate carrying this meter everywhere"
- "I don't want to explain why I'm not eating cake to my coworkers"

A copywriter would assume they're thinking about long-term death or amputation, but they're actually thinking about **where the nearest bathroom is**.

Level 2 — Emotions

Emotion	Triggered By	What It Makes Them Do
Fatigue	Waking up	Cancel social plans
Frustration	High morning meter readings	Want to quit their diet
Anger	Doctor visits	Seek alternative health information

Fatigue is the safest emotion to open with. Opening with Shame will make them highly defensive.

Level 3 — Beliefs (Sequence of Belief Change)

1. They must believe their high morning numbers are **caused by the liver**, not by failing their diet
2. They must believe Metformin **only masks** the liver issue
3. They must believe natural foods **can unclog the liver**

If you attack their diet before explaining the liver, they will feel blamed and leave.

Level 4 — Identity

How They Describe Themselves	What They Aspire To	Labels They Fear
"tired," "frustrated," "a joke," "diabetic," "someone like me," "hard worker," "a cancer patient," "hypochondriac"	"Healthy," "independent," "in control"	"Lazy," "glutton," "burden"

A false label sounds like: "You are a warrior battling diabetes!" This lands as condescending to someone who just wants to take a normal poop and stay awake past 3 PM.

Level 5 — Consciousness (How to Write)

Their dominant level is **Apathy**. Copy must sound:

- Validating, tired, and deeply empathetic
- Short sentences. Plain words
- Acknowledge the daily, physical grind
- Move them from Apathy up to Anger by validating that the medical system has failed them
- No high-energy hype
- No exclamation marks or "miracle" claims

Writing to the Lowest Levels

They currently blame themselves for eating too many carbs and lacking willpower. The **true external cause** that takes the blame off them is Hepatic Insulin Resistance — their liver is mechanically stuck dumping sugar, and willpower cannot fix a mechanical issue. Give them permission to be angry at a medical system that treats symptoms instead of the liver.

The Outsider Test

If any of these sound like your copy, rewrite it:

1. Recommending they "just exercise more" when they can barely walk from the parking lot
2. Telling them to be positive and smile through the journey
3. Assuming they still trust their primary care doctor
4. Calling them a "sugar addict"
5. Writing with a high-energy, hyped-up marketer tone

PART 3: VOICE OF THE MARKET

Real quotes, recurring themes, and the language that builds trust

Section 6 — Real Patient Quotes

These are **real words from real people** who have Type 2 diabetes. They come from Reddit, diabetes forums, Quora, TrustPilot reviews, and Google searches. Each quote is grouped by the emotion behind it.

1.1 Frustration After Failed Attempts

These people have tried everything and feel like nothing works:

"Metformin practically put me in a coma."

"I had no idea how much fatigue I had been experiencing until today."

"I just couldn't deal with sleeping 16 hours a day and the rest of the time too tired to get off the couch."

"I hate Metformin, so tired of the runs and discomfort."

"It feels like I am shooting alcohol out of the wrong hole."

"Dropping 30 points a day, every day, to deal with your stupid liver is a real grind."

"I was shocked when I realized how much my dinner could affect my mornings."

1.2 Giving Up & Lost Hope

"I am so very fatigued and weak on this med."

"It's like your liver WANTS to be diabetic."

"I had taken metformin for 10+ years, always made me feel sick. Never felt like myself."

"A1c is a 13.5... so tired of this struggle... spent a lot of money, popped lots of different pills."

"I'm afraid it's already over for me and I'm afraid of what's going to happen next."

"I don't even know why I keep trying."

1.3 Anger — Blaming Doctors and the System

"I called my dr after a week and asked for something else and was told to stick with it."

"Wow, I'm sorry your doctor was such a jerk."

"I wasn't even prepared to feel these side effects bc my doctor didn't warn me."

"While on it they just wanted to prescribe more diabetes meds and I developed fatty liver."

"If your doctor won't listen to your concerns, then get another one."

1.4 Shame — Hiding It From Everyone

"I am afraid of being more of a joke than I already am."

"You can tell by looking at me that any diabetic problems I have are my own damn fault."

"Ashamed and embarrassed. And really mad at myself for letting this happen."

"My aunts and uncles thought I was hiding cancer from them."

"I used to hide it. I thought people would think of me differently."

1.5 Fear of What Comes Next

"I don't want to die. Not because of this."

"I don't know if I could stomach giving myself insulin."

"Just diagnosed and scared to death."

"I worry about ruining my health when I'm making progress."

"I am constantly afraid of the embarrassment that will inevitably follow diagnosis."

1.6 Cautious Hope — Willing to Try One More Time

"Very few side effects and rybelsus, a1c is at 5.0."

"I started skipping breakfast... the intermittent fasting has helped."

"Result is that today my a1c is 4.9 without meds or even exercise."

"Having a mostly empty stomach with just the eggs in there when I go to bed fixed the dawn phenomenon for me."

1.7 Discovery — Something Actually Worked

"A1C was stuck at 8, and my new doctor convinced me to change my diet."

"It only took two rice cakes with honey to shoot my numbers up to 212."

"Go for a 30 min walk. Measure again. You'll be surprised how much you can shave off."

1.8 Questions They Ask Online

- "Anyone getting absolutely wiped out about an hour after taking metformin?"
- "Is the dawn phenomena really something negative?"
- "What would cause a t2 to have dawn phenomenon?"
- "Why do diabetics have to constantly measure their blood sugar?"
- "Should I be scared of diabetes?"
- "Do you think it was high because of the honey?"

1.9 Scam Detection — They've Been Burned Before

"I can't believe that Dr Phil and Dr Oz would collaborate with this pill."

"WARNING — A total scam. Dr Phil and Dr Oz ought to be ashamed."

"Instead of 40 mins waffling on, seems the American way: talk about shit till you mesmerize them."

"The company is a rip off with their subscription service."

"What an elaborate scheme to prey on weakness and insecurities."

1.10 One-Star Reviews of Competitor Products

"It provided no improvement in my glucose readings." — Dr Phil Sugar Control

"My sugar counts gone up not down and that crap you sell as weight loss..." — Dr Phil Sugar Control

"This is a crooked operation." — Renu Glyco

"I was so impressed with the video that I ordered 19 bottles... The product was upsetting my digestive tract." — FitSpresso

1.11 What People Like About Competitor Products (5-Star)

"SugarBalance caught my eye because of the herbal ingredients, and I liked that it didn't have a bunch of chemicals."

"What impressed me most was how natural it felt. Unlike other products I've tried, SugarBalance didn't give me any side effects."

"It felt gentle on my body but was still highly effective."

1.12 What People Search on Google

These are the actual Google autocomplete phrases for diabetes:

- how to lower morning blood sugar naturally
- why does metformin make me so tired
- natural alternatives to metformin for type 2 diabetes
- does honey spike blood sugar in diabetics
- how to stop dawn phenomenon diabetes

Section 7 — Most Common Themes

After analyzing hundreds of real patient comments, here are the themes that came up **most often**, ranked by how many times people mentioned them:

#	What People Are Saying	How Often	Type
1	"I'm completely exhausted all the time and the pills make my stomach hurt terribly"	15 mentions	General complaint
2	"My blood sugar is high in the morning even when I do everything right"	12 mentions	General complaint
3	"I'm terrified people will find out and judge me — I think I did this to myself"	10 mentions	Shakeable belief
4	"My doctor doesn't listen and just wants to give me more pills"	9 mentions	Firm belief
5	"I want to manage this naturally without living in the bathroom"	8 mentions	Desire
6	"I bought a product that promised to cure me, but it was just an auto-billing scam"	8 mentions	General complaint
7	"I don't understand why my body makes so much sugar when I sleep"	7 mentions	General complaint
8	"I want my energy back so I can enjoy my daily life"	6 mentions	Desire
9	"I feel like a failure because nothing I try seems to fix my numbers for good"	6 mentions	Shakeable belief
10	"I'm scared this disease will slowly destroy my health and my body"	6 mentions	Desire
11	"Eating a heavy meal before bed actually makes my morning numbers better"	5 mentions	General complaint
12		5 mentions	Identification

"I want to use natural remedies instead of Big Pharma drugs"

13	"I hate pricking my finger all the time to know what's going on"	4 mentions	Desire
14	"I believe honey is safe because it's natural"	4 mentions	Shakeable belief
15	"I'm an older adult just trying to maintain my independence"	3 mentions	Characteristic

The three biggest takeaways:

1. They are **desperate for energy** and relief from their medication's brutal side effects
2. They want a **logical explanation** for why their morning numbers are so high even when they eat perfectly
3. They want a **natural, sustainable solution** that doesn't make them feel sick, tired, or broken

Section 8 — Language Translation Guide

This section shows you how doctors, marketers, and **actual patients** describe the same things. Always use the patient language in your copy — it builds instant trust.

The Thing	Doctors Say	Marketers Say	Patients Say
Morning sugar spike	Dawn Phenomenon	Morning sugar spike	"My highest reading I get all day"
Diabetes medication	Metformin	Prescription blood sugar pills	"Metformin practically put me in a coma"
Long-term sugar average	Hemoglobin A1c	Your blood sugar score	"My A1c is newly into the diabetic range"
Medication side effects	Gastrointestinal distress	Digestive discomfort	"The crap your pants kind"
Constant tiredness	Lethargy / clinical fatigue	Low energy levels	"Insane debilitating fatigue"
Shame about diagnosis	Diabetes distress	Feeling down about health	"I'm afraid of being more of a joke than I already am"
Blood sugar monitor	Glucometer	Blood sugar monitor	"Finger prick meter"
Low-carb dieting	Dietary carb restriction	Keto or low-carb diet	"Cutting out everything I love"
Liver dumping sugar	Hepatic gluconeogenesis	Your liver dumping sugar	"My liver being a jerk"
Insulin	Insulin	Fat-storing hormone	"Stomach giving myself insulin"
Cells ignoring insulin	Insulin resistance	Locked cells	"My body drops water quickly"
Nerve damage	Diabetic neuropathy	Nerve pain	

			"Nerves are raw after being surrounded by thick, sugary blood"
Low sugar crash	Hypoglycemia	Dangerous blood sugar drops	"Having a bad low in front of a date"
Bathroom emergencies	Fecal incontinence	Bathroom emergencies	"Sudden pants-crapping"
Brain fog	Cognitive impairment	Brain fog	"Insane fatigue and brain fog"
Being tricked by supplements	Consumer fraud	False promises	"Crooked operation"
Hidden subscription fees	Unauthorized recurring charges	Hidden fees	"Rip off with their subscription service"

Words That Build Trust

Using phrases like **"liver dumping glucose," "exhaustion," "bathroom emergencies,"** and **"dawn phenomenon"** shows you actually understand their daily reality. When you mention the dawn phenomenon correctly, they know you've studied the disease — because most general doctors don't even explain it well.

Words That Kill Trust Instantly

Phrases like **"Dr. Phil endorsed," "Shark Tank," "miracle cure," "subscription,"** and **"auto-ship"** are massive red flags. These trigger their scam alarm immediately because they've been burned by countless fake supplement scams.

The 15 Most Powerful Patient Phrases

Use these in your copy — they come straight from the VOC library:

- "shooting alcohol out of the wrong hole"
- "the crap your pants kind"

- "insane debilitating fatigue"
- "sleeping 16 hours a day and the rest of the time too tired"
- "my highest reading I get all day"
- "deal with your stupid liver"
- "afraid of being more of a joke than I already am"
- "my own damn fault"
- "cutting out everything I love"
- "nerves are raw after being surrounded by thick, sugary blood"
- "crooked operation"
- "spent a lot of money, popped lots of different pills"
- "It's like your liver WANTS to be diabetic"
- "shaking it off"
- "I just couldn't deal"

PART 4: PROOF AND MECHANISM

What evidence exists and how the solution works

Section 9 — Proof That Works

This is what evidence exists, what's real, what's fake, and what you're legally allowed to say.

4.1 Real Clinical Studies

A clinical trial with 53 Type 2 diabetes patients found that eating 50 grams of honey per day for 8 weeks actually **increased** their HbA1c (made their sugar worse). This is important because it directly measures the product's likely effect.

On the other hand, Dr. Jason Fung's clinical case studies show that **intermittent fasting** effectively lowers HbA1c, reduces waist size, and allows patients to safely stop insulin. This is strong evidence for fasting over sweeteners.

4.2 The Honey Problem — READ THIS CAREFULLY

CRITICAL WARNING: The idea that honey can naturally reverse diabetes is **completely contradicted** by the best available medical evidence.

- Clinical trials prove daily honey consumption **worsens** long-term blood sugar control and **raises** HbA1c in Type 2 diabetics
- Honey is high in fructose, which bypasses normal metabolism, goes straight to the liver, increases liver fat creation, and **directly worsens** insulin resistance
- Fructose causes the exact "dawn phenomenon" that this market despises
- Any angle claiming honey reverses diabetes is **scientifically dead, legally dangerous**, and a target for federal regulators

The copywriter must pivot entirely to a whole-foods and fasting lifestyle approach.

4.3 Things They Can Verify Themselves

These are "try it yourself" proofs that work because the buyer can test them at home:

- Check your blood sugar before eating honey. Check again 2 hours later. Watch it spike violently.
- Skip dinner or eat a very early, light dinner. Check your morning fasting sugar the next day — it drops.
- Walk for 30 minutes in the morning. Check your blood sugar after — it drops on the meter.

4.4 Hard Numbers (CDC Data)

- In 2022, **14.3% of US adults** had diagnosed diabetes
- An estimated **40.1 million cases** exist in the US alone

4.5 Regulatory Reality (FTC & FDA)

- The FTC and FDA regularly send warning letters to supplement companies that claim their products "cure, treat, mitigate, or prevent" diabetes
- The FDA has cracked down on honey-based supplements spiked with hidden drugs or making false health claims

4.6 What You Can and Cannot Say (Legal)

BANNED: You cannot claim a supplement or food "cures" or "reverses" diabetes. The FTC has fined companies millions for these exact claims. The word "cure" is strictly forbidden.

ALLOWED: "Supporting healthy blood sugar levels already in the normal range" or "promoting metabolic health." Stick to these phrasings.

4.7 What Kind of Proof This Buyer Trusts

- **Their own blood glucose meter** — they trust their own numbers above everything
- **Real patient stories** from people who post their actual A1c numbers in forums
- **They completely distrust:** celebrity doctor endorsements (Dr. Oz, Dr. Phil), Shark Tank claims, and long video sales letters that hide the real price until the very end

Section 10 — The Mechanism & the Belief Bridge

10.1 The Problem Mechanism (What's Actually Happening)

The liver becomes packed with fat, making it deaf to insulin, so it continues to dump stored sugar into the blood all night long. Medical term: **Hepatic Insulin Resistance**.

10.2 Why They Already Believe This

They've already personally noticed that even if they eat zero carbs for dinner, they still wake up with a high blood sugar number. **The liver dumping sugar explains this perfectly** — and it matches their lived experience.

10.3 The Solution Mechanism

By eating specific natural whole foods and adjusting eating windows (intermittent fasting), you drain the fat out of the liver, restoring its ability to hear insulin and **stopping the overnight sugar dumps**.

10.4 The Belief Bridge — 5 Steps

This is the exact sequence of beliefs the buyer needs to walk through to be ready to buy:

1. **You already know** that Metformin is just masking the symptoms and making you sick
2. **You have noticed** that your blood sugar is surprisingly high in the morning even if you ate perfectly the day before
3. **This happens because** your liver, not your stomach, is dumping sugar into your blood while you sleep
4. **The liver does this because** it is clogged with fat and cannot hear the signals to stop

5. **By using** a natural food protocol to drain the liver fat, the liver stops dumping sugar, and your morning numbers return to normal

10.5 The Analogy

"Your liver is like a sponge soaked in greasy water; until you wring the grease out of the sponge, it cannot absorb any more sugar from your bloodstream."

10.6 The Four Best Mechanism Explanations

1. Hepatic Insulin Resistance

The problem: Your liver is clogged with fat, causing it to blindly dump sugar into your blood all night.

The solution: This protocol drains the fat from your liver, restoring its natural communication so it stops the morning sugar dumps.

Grounded in: *"Sometime it'll be the highest reading I get all day."*

Science: Real (Hepatic insulin resistance and gluconeogenesis) | **Believable:** 9/10 |

Legal risk: Safe | **Evidence:** Strong

Best for: Problem Aware, Level 3

2. The Glycogen Overflow

The problem: Your liver's sugar storage tanks are completely full, so any new food spills directly into your bloodstream.

The solution: This program empties the storage tanks, giving the sugar a safe place to go.

Grounded in: *"Dropping 30 points a day... to deal with your stupid liver."*

Science: Real (Hepatic glycogen capacity) | **Believable:** 8/10 | **Legal risk:** Safe |

Evidence: Strong

Best for: Problem Aware, Level 3

3. The Cortisol Sugar Dump

The problem: The stress of waking up triggers a hormone that forces your liver to release emergency sugar.

The solution: This lifestyle approach calms the morning cortisol response and improves insulin sensitivity.

Grounded in: *"The liver gives you a whole bunch of sugar in the very early morning."*

Science: Real (Cortisol awakening response) | **Believable:** 7/10 | **Legal risk:** Safe | **Evidence:** Strong

Best for: Solution Aware, Level 4

4. The Fructose Trap

The problem: The hidden fructose in "healthy" sweeteners went straight to your liver and turned into fat.

The solution: We remove the liver-clogging fructose and replace it with foods that heal the metabolic environment.

Grounded in: *"Even a little bit will raise my blood sugar."*

Science: Real (Fructose induces hepatic lipogenesis) | **Believable:** 6/10 | **Legal risk:** Safe | **Evidence:** Strong

Best for: Solution Aware, Level 3

Note: Only 4 mechanisms could be grounded in reality without violating medical evidence or inventing fake processes. A short, honest list of 4 is worth more than inventing fake mechanisms that will get ad accounts banned and companies fined by the FTC.

PART 5: COMPETITIVE LANDSCAPE

Who else is selling to this buyer and where they fail

Section 11 — Competitors & Their Weaknesses

Dr Phil Sugar Control

Their claim: "Advanced support for healthy blood sugar balance"

Targets: Solution Aware buyers

What works: People inherently like celebrity endorsements

Weakness: It is perceived as a massive scam

Real complaint: *"My sugar counts gone up not down and that crap you sell as weight loss..."*

FitSpresso

Their claim: "Weight loss and blood sugar control via a coffee loophole"

Targets: Solution Aware buyers

What works: The 30-minute video sales letter hypnotizes some desperate buyers

Weakness: Severe digestive issues and forced continuity billing traps

Real complaint: *"The product was upsetting my digestive tract... elaborate scheme to prey on weakness"*

Renu Glyco

Their claim: "Wellness-focused brand for metabolic health"

Targets: Solution Aware buyers

What works: Sounds clinical, safe, and professional

Weakness: Predatory subscription models

Real complaint: *"I cancelled the subscription in May and in June I received another package."*

The Big Opportunity

What all competitors have in common: They're all selling a magic pill that supposedly fixes blood sugar without any lifestyle changes. They all use shady billing practices and long video pitches. That sameness is the opening. **A program that demands real food and honesty will stand out dramatically.**

Section 12 — What This Market Is Missing

5.1 The Universal Complaint

Across every competitor product review, three complaints dominate:

Complaint	Where It Shows Up	What Buyers Say
The product did nothing	Dr Phil Sugar Control, Sugar Harmony, Glyco Result	"My sugar counts gone up not down and that crap you sell as weight loss..."
Hidden subscription billing	Renu Glyco, FitSpresso	"The company is a rip off with their subscription service."
Wasted time on a long video	FitSpresso, Dr Phil Sugar Control	"Instead of 40 mins waffling on, seems the American way: talk about shit till you mesmerize them."

5.2 The Unmet Need

They are **begging** for an honest, scientific explanation of why their liver dumps sugar in the morning (the dawn phenomenon) and a concrete way to stop it **without** taking a prescription drug that causes severe diarrhea and lethargy.

5.3 The Emotional Gap No Competitor Fills

Every competitor in this space ignores the **deep psychological shame** of the diagnosis. They all focus on the mechanics of blood sugar or pitch fake miracle cures. **Nobody is looking the prospect in the eye and saying:**

"It is not your fault. You did not eat your way into this. You just have a liver that is mechanically stuck in the wrong gear."

5.4 What They Wish Someone Would Just Tell Them

They want a doctor or expert to honestly admit that the standard advice (eat whole grains, take Metformin) is fundamentally failing them. They want someone to **clearly explain** what is happening inside their liver while they sleep, and why standard treatments are only masking the problem.

PART 6: OFFER AND CREATIVE DIRECTION

Pricing, angles, hooks, and required reading

Section 13 — Offer & Pricing Intelligence

11.1 Price Landscape

Competitor pills cost between **\$50 and \$100 per bottle**.

- Over \$100 reads as a scam
- Under \$30 reads as cheap junk

11.2 The Comparison Anchor

The hundreds of dollars they already spend **out of pocket every single year** on testing strips, doctor co-pays, and Metformin prescriptions.

11.3 Guarantees

The category offers standard 30 or 60-day money-back guarantees, but buyers report these are often fake and companies refuse to refund. **A true "no questions asked, keep the materials" guarantee would completely remove the fear of being scammed.**

11.4 Bonuses They Would Genuinely Want

- A guide to surviving restaurant menus without spiking blood sugar
- A cheat sheet for what to eat right before bed to minimize the dawn phenomenon

11.5 What Makes Them Abandon a Purchase

Seeing the word **"subscription"** or **"auto-ship"** in the cart. These are instant deal-breakers.

Section 14 — Ad Angles & Hooks

The 5 Core Ad Angles

Angle 1 — The Morning Sugar Dump

Mechanism: Hepatic Insulin Resistance

Proof: Studies showing the liver releases glucose overnight and causes the Dawn Phenomenon

Target avatar: The person frustrated by high morning readings despite a perfect diet

Emotional level: Anger

IVOC origin: *"I am so frustrated that my blood sugar is high in the morning even when I do everything right."*

Angle 2 — The Bathroom Prisoner

Mechanism: Metformin GI Distress

Proof: FDA labeling and widespread patient reporting of Metformin side effects

Target avatar: The person tired of fecal incontinence and stomach pain

Emotional level: Apathy

IVOC origin: *"I am completely exhausted all the time and the pills make my stomach hurt terribly."*

Angle 3 — The Energy Thief

Mechanism: Cellular Starvation (Insulin Resistance)

Proof: Clinical definitions of insulin resistance preventing glucose from entering cells for energy

Target avatar: The person who sleeps 12 hours and is still exhausted

Emotional level: Apathy

IVOC origin: *"I want my energy back so I can actually enjoy my daily life."*

Angle 4 — The Fake Miracle

Mechanism: Fructose Trap (why other supplements fail)

Proof: Studies showing fructose increases liver fat and worsens insulin resistance

Target avatar: The skeptic who has been scammed by fake celebrity pills

Emotional level: Anger

IVOC origin: *"I bought a product that promised to cure me, but it was just an auto-billing scam."*

Angle 5 — The Dieting Trap

Mechanism: The Glycogen Overflow

Proof: Clinical trials showing fasting and whole foods deplete liver glycogen

Target avatar: The person tired of starving themselves on strict keto with no lasting results

Emotional level: Apathy

IVOC origin: *"I feel like a failure because nothing I try seems to fix my numbers for good."*

15 Ready-to-Use Hooks

Hook 1 (Angle 1): "Why your liver WANTS to be diabetic while you sleep."

Hook 2 (Angle 1): "Are you tired of dropping 30 points a day just to deal with your stupid liver?"

Hook 3 (Angle 1): "The real reason your morning number is the highest reading you get all day."

Hook 4 (Angle 2): "How to escape the 'crap your pants' side effects of your daily pill."

Hook 5 (Angle 2): "Tired of shooting liquid out the wrong hole just to manage your sugar?"

Hook 6 (Angle 2): "I stopped taking it completely to save my stomach."

Hook 7 (Angle 3): "Sleeping 16 hours a day and still too tired to get off the couch?"

Hook 8 (Angle 3): "The hidden cause of your insane debilitating fatigue."

Hook 9 (Angle 3): "Why your pills are practically putting you in a coma."

Hook 10 (Angle 4): "Don't fall for another crooked operation promising a miracle."

Hook 11 (Angle 4): "The truth behind those million-dollar celebrity sugar pills."

Hook 12 (Angle 4): "Stop popping lots of different pills that do absolutely nothing."

Hook 13 (Angle 5): "Tired of cutting out everything you love for zero results?"

Hook 14 (Angle 5): "Why your nerves are raw after being surrounded by thick, sugary blood."

Hook 15 (Angle 5): "Stop feeling like your diagnosis is your own damn fault."

Section 15 — Must-Read Sources for the Copywriter

If you're writing copy for this market, read these threads and reviews to hear the voice of this buyer firsthand:

Reddit Threads ([r/diabetes_t2](#))

1. **Metformin and Fatigue** — Understand the soul-crushing fatigue Metformin causes and how doctors ignore it
2. **"I Hate Metformin"** — The raw anger at digestive side effects and the phrase "crap your pants kind"
3. **"I Hate Metformin, So Tired of the Runs"** — The desperation of trying to work a normal job while tied to a bathroom
4. **"Metformin Makes Me Feel Terrible"** — How a new diagnosis quickly turns into medical trauma
5. **"Is the Dawn Phenomena Really Something Negative?"** — The confusion and debate around the dawn phenomenon
6. **"What Would Cause a T2 to Have Dawn Phenomenon?"** — The perfect avatar explanations of liver sugar dumping ("your liver being a jerk")
7. **"Dawn Effect Frustrations"** — The absolute frustration of doing everything right and waking up to a high number
8. **"Dawn Phenomenon" Discussion** — Real people discussing how fasting and insulin resistance actually work
9. **"Feeling Frustrated With High Morning Sugars"** — The daily emotional toll of tracking numbers that don't make sense
10. **"I Believe I'm Prediabetic or Worse, and I Am Deeply Ashamed"** — The deep, paralyzing shame and fear of being judged
11. **"Newly Diagnosed and Feeling Ashamed"** — The internal guilt trip upon diagnosis
12. **"A Colleague Constantly Mentions My Diabetes"** — Why they hide their disease from coworkers and hate unsolicited advice

Diabetes Forum Threads

1. **"A Teaspoon of Honey Before Bed for Blood Sugar Control"** — The market's confusion about natural sweeteners and why the honey angle is fundamentally flawed
2. **"New to Prediabetes" Discussion** — Veteran diabetics warning newbies that sugar is sugar, no matter where it comes from
3. **"Looking for Information"** — The regret of someone who spiked their blood sugar just to prove a point to friends

TrustPilot Reviews

1. **Dr Phil Sugar Control (1-star reviews)** — Memorize exactly what fake marketing sounds like to this audience
2. **FitSpresso (1-star reviews)** — See how much they hate long, manipulative video sales letters and forced subscriptions
3. **Renu Glyco (1-star reviews)** — Understand the fury of being billed for products that don't work

Clinical Studies

1. **PMC: Intermittent Fasting for Diabetes** — How intermittent fasting actually reverses the disease
2. **PMC: Honey and HbA1c** — Why claiming honey lowers HbA1c is factually wrong and dangerous
